

Land-Cover/Land-Use Interactions with Climate in the Boreal Zone

Garik Gutman, NASA Headquarters,
Washington, DC, USA

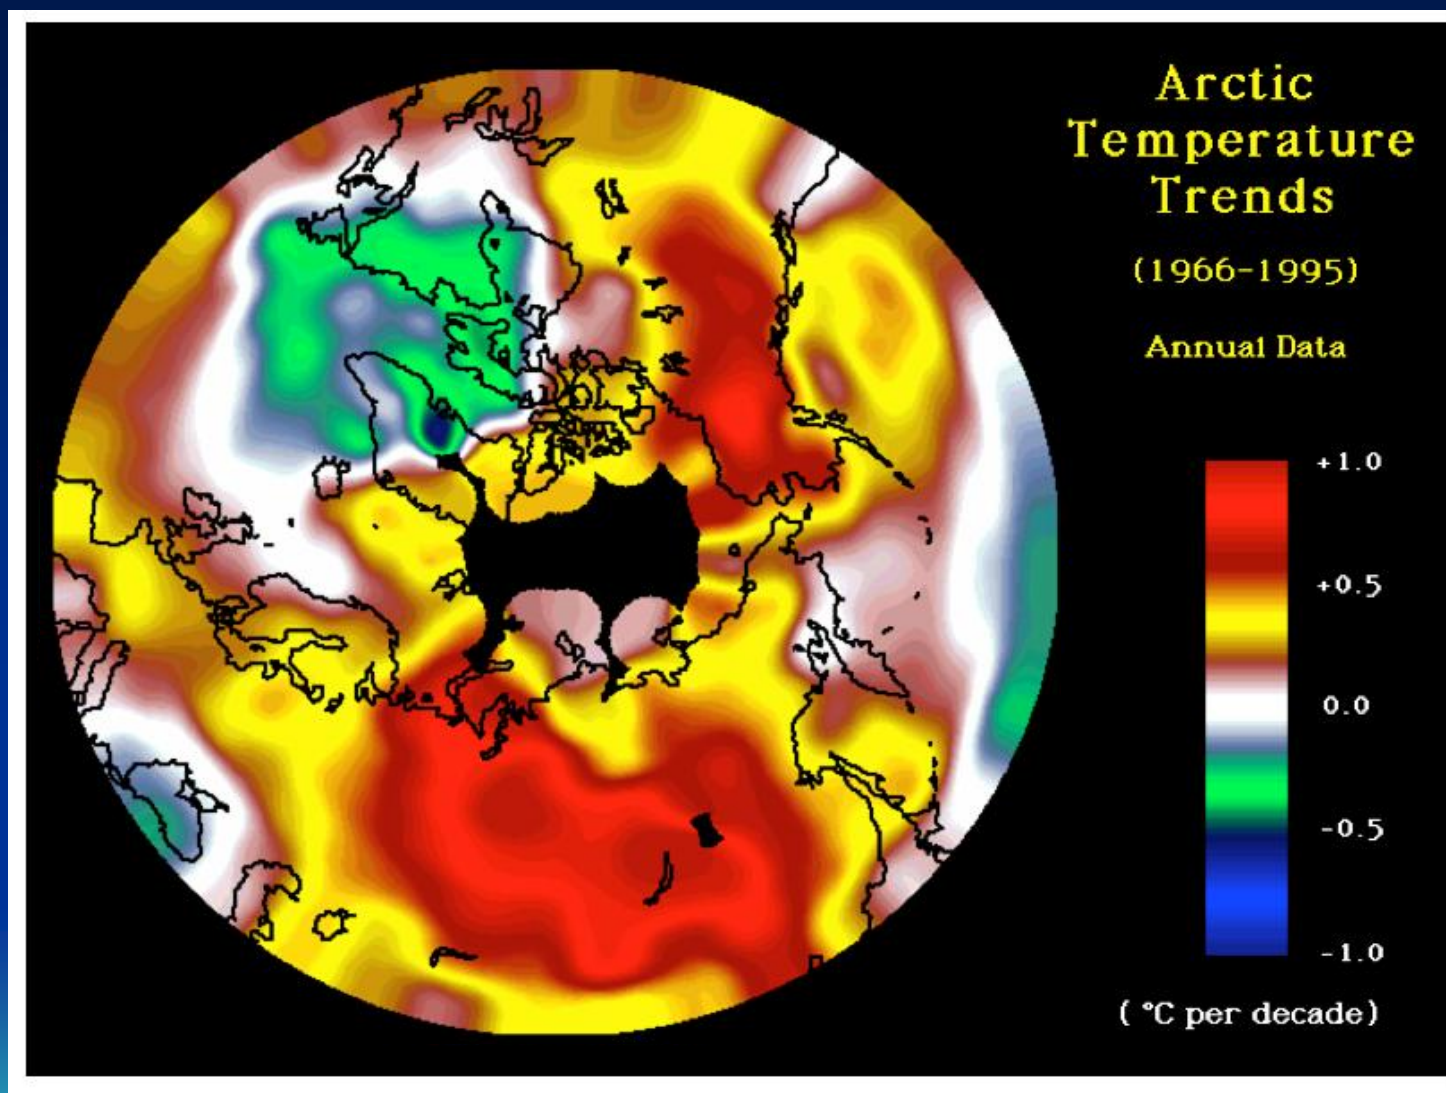

Outline

- Climate-Land Cover Interactions
- Potential of Remote Sensing
- NEESPI (Northern Eurasia Earth Science Partnership Initiative) – only briefly, more on July 8 at the NELDA workshop

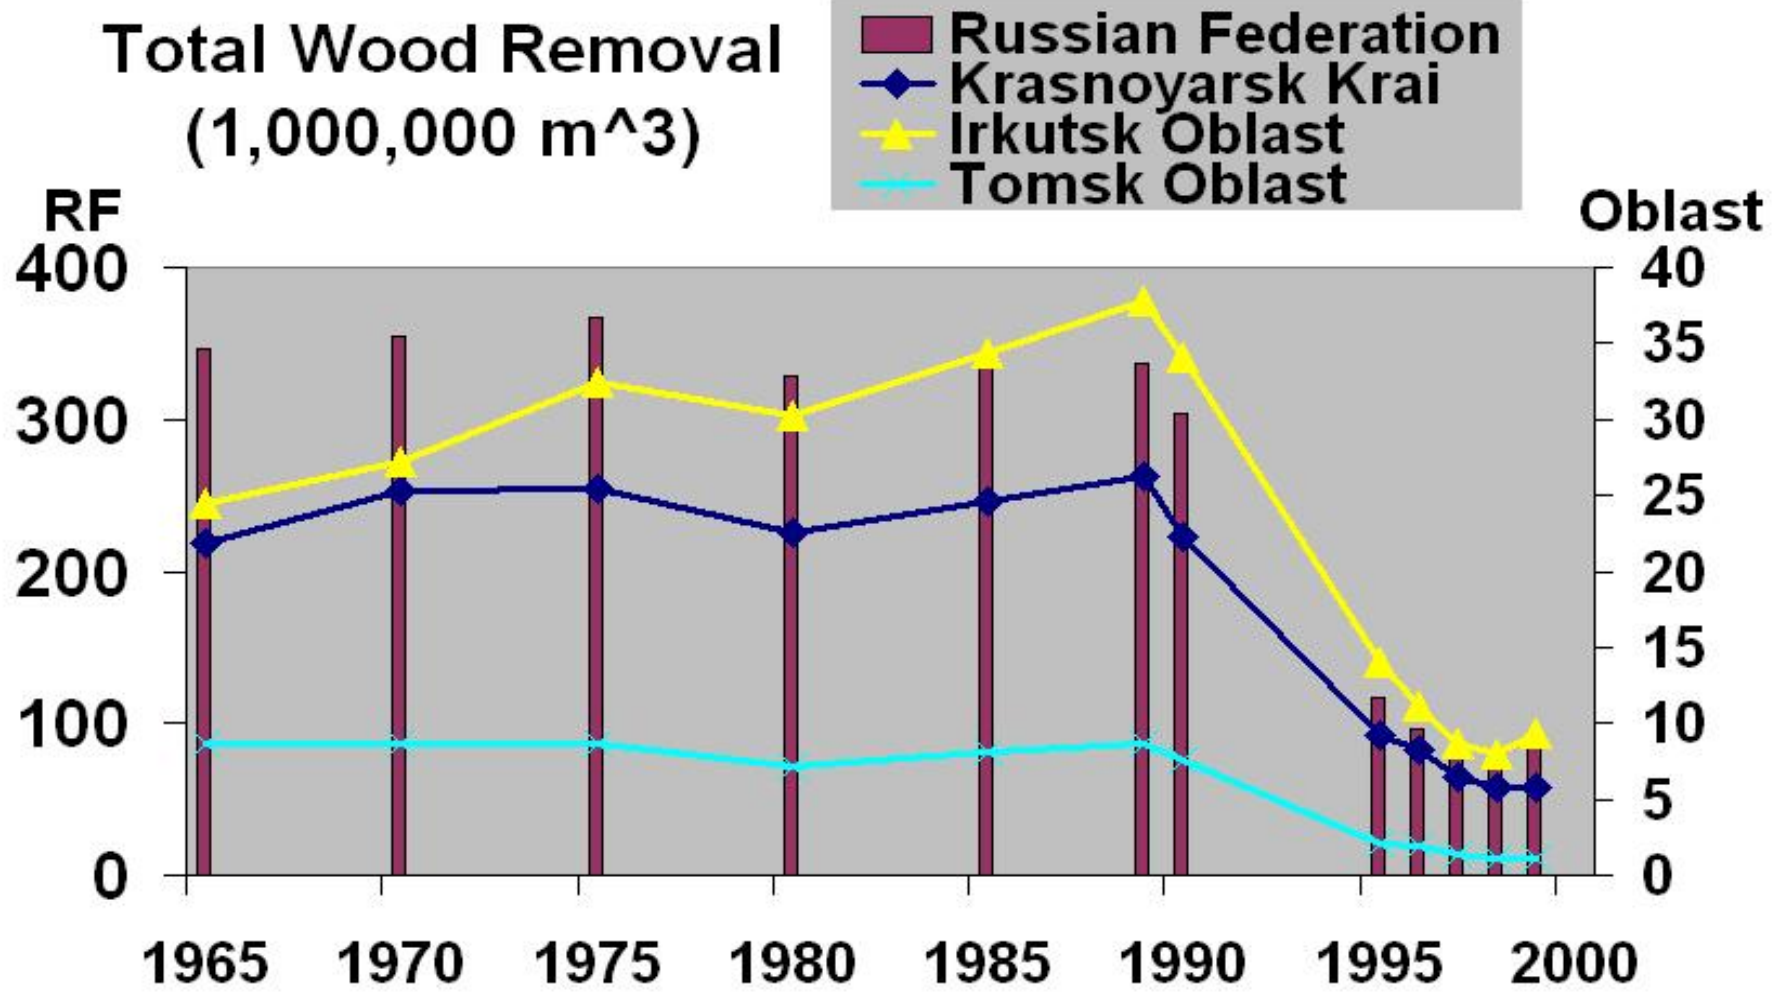

Climate Change and Variability

Observed Warming Trend From: Serreze, MC, et al. 2000.
Observational Evidence of Recent Change in the Northern High-
latitude Environment. Climatic Change 46:159-207.

Land Use

Total Wood Removal (1,000,000 m³)

The Basic Science Question

What are the consequences of such changes and are there significant feedbacks to the atmosphere from terrestrial ecosystems?

Implications of Change

- Carbon Cycle change (release/uptake)
- Hydrologic change (drainage/transpiration)
- Land-cover and land-use change (both climate- and human-induced)

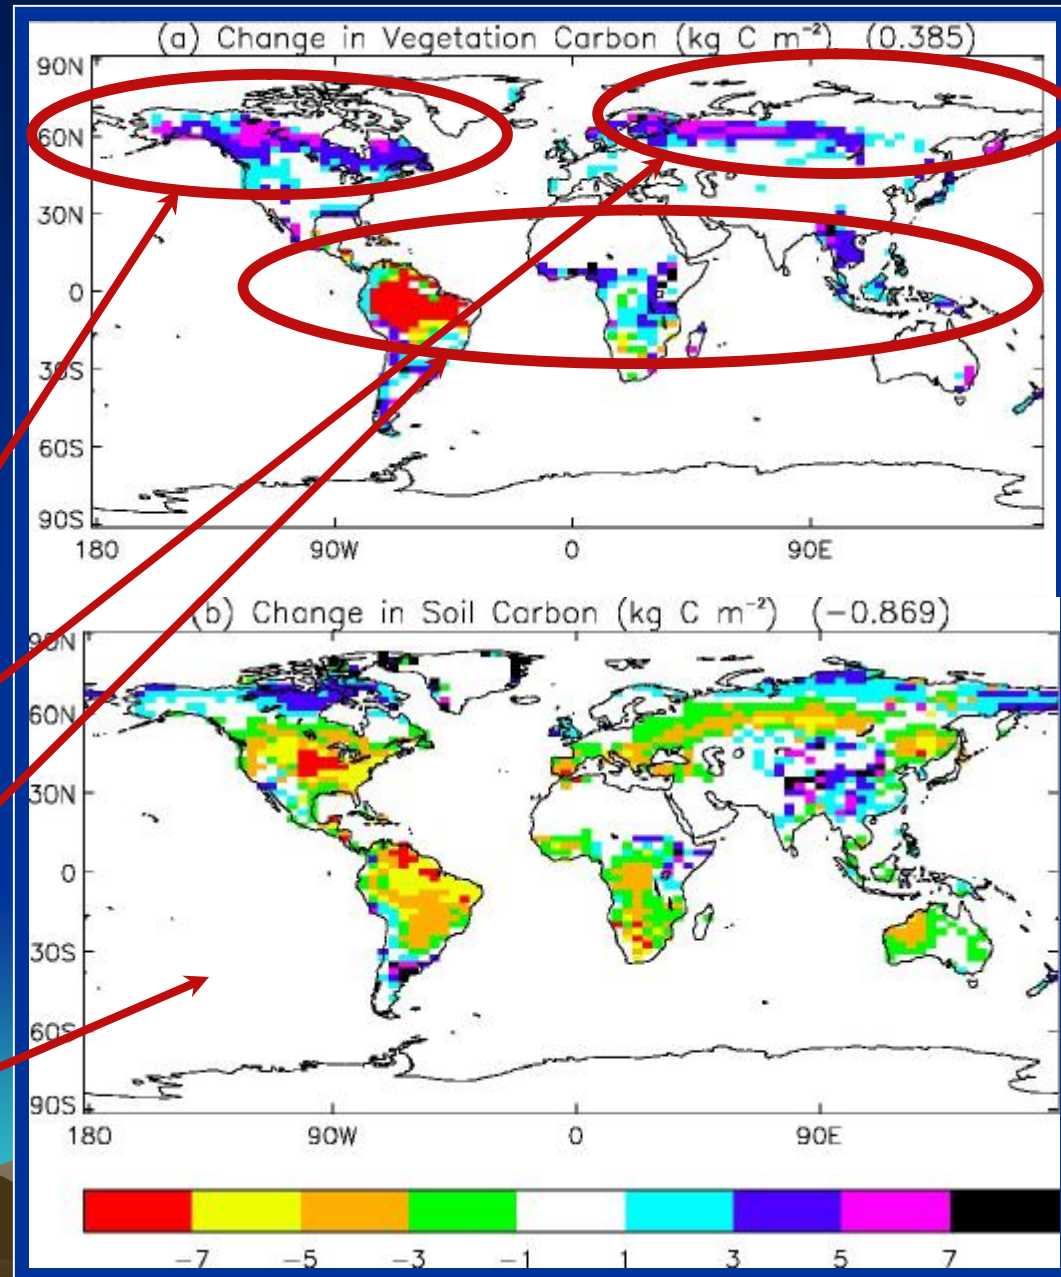

Simulated Changes in
Carbon Storage
Hadley Center Model
1860-2100

- Broadleaved (12)
- Temperate forest-steppe (13)
- Temperate steppe (14)

Tchebakova, N., and E. Parfenova (2004), Possible vegetation changes in Arctic and Boreal regions due to climate warming, in *Feasibility Workshop for Circumpolar LIDAR Mapping for Biomass Carbon Assessment and Vegetation Change Monitoring*, pp. in press, Waseda University, Tokyo.

Results of GCM Simulations

Clearing the boreal forest has a strong cooling effect in GCM climate simulations

Bonan, G.B., D. Pollard and S.L. Thompson, 1992. Effects of boreal forest vegetation on global climate. *Nature* 359:716-718

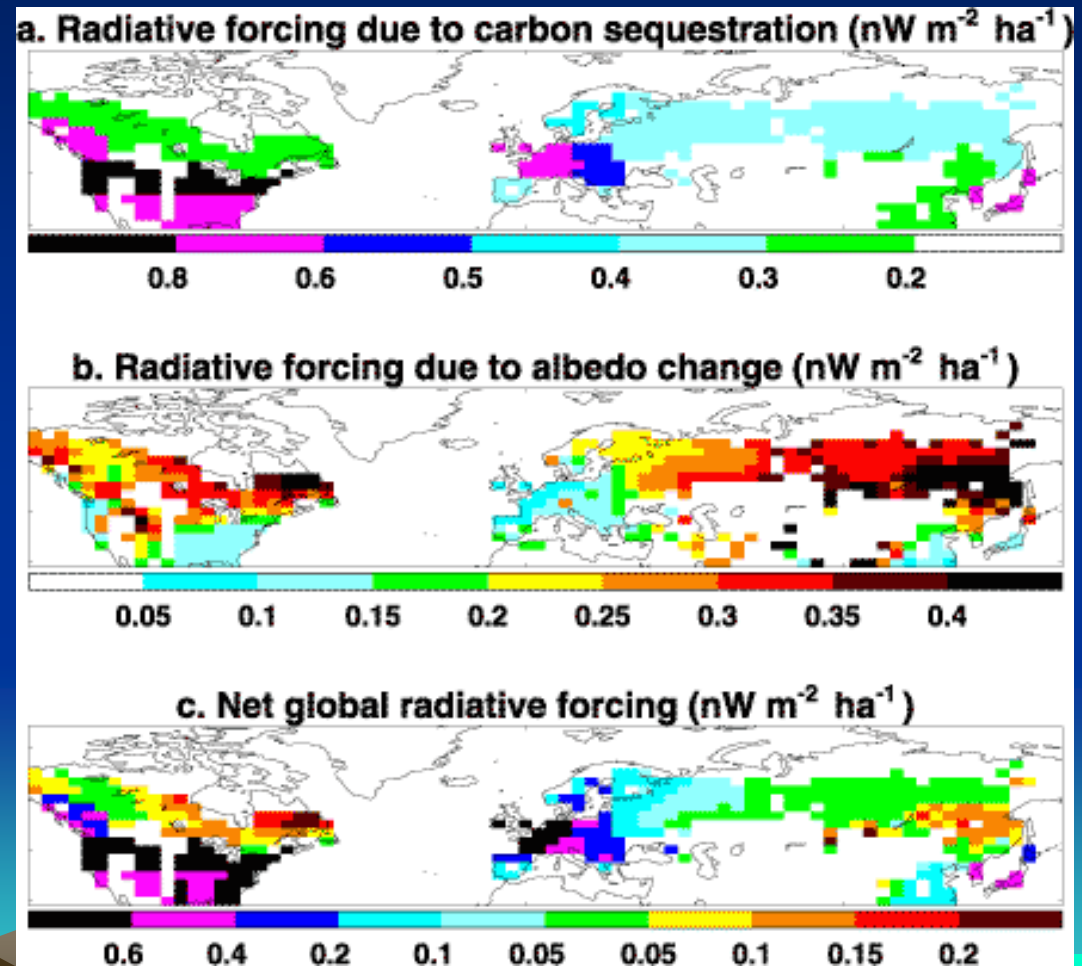

Growing Eurasian forests has a warming effect in GCM climate simulations

Betts, R.A., 2000. Offset of the potential carbon sink from boreal forestation by decreases in surface albedo. *Nature* 408:187-190.

Radiative Forcing

- in large parts of the temperate and boreal forest areas, the decrease in surface albedo by forestation is as important as carbon sequestration in its forcing of climate. As a result, forest carbon sinks in these regions could exert a much smaller cooling influence than expected, or even exert an overall warming influence

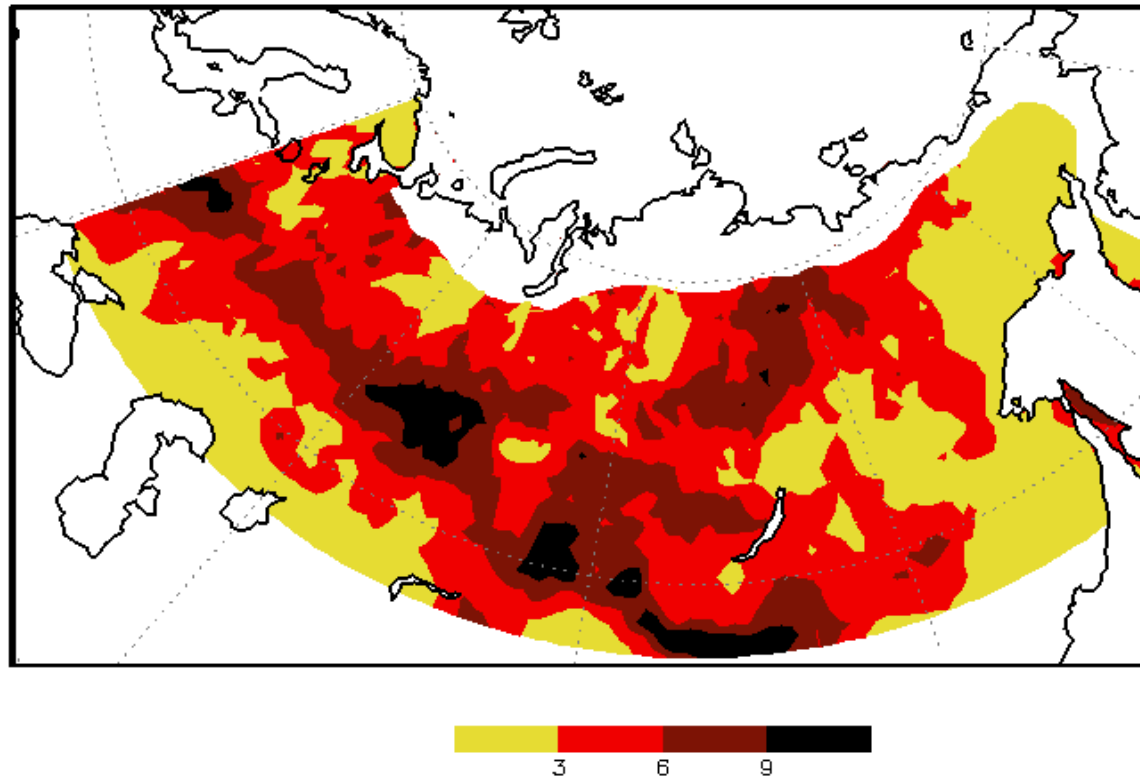

Estimating Disturbances

Fire, under the control of climate, is a major driving force of land cover change in remote boreal regions

Projected change of the number of days with highest probability of forest fire by the end of the 21st century: 9-member ensemble of IPCC AR3 AOGCMs, B2 emission scenario.

Estimating Disturbances

Insect outbreaks have always been a major factor initiating change in the boreal zone.

Can our models provide an operational interface between ground and remote sensing data for data assimilation ?

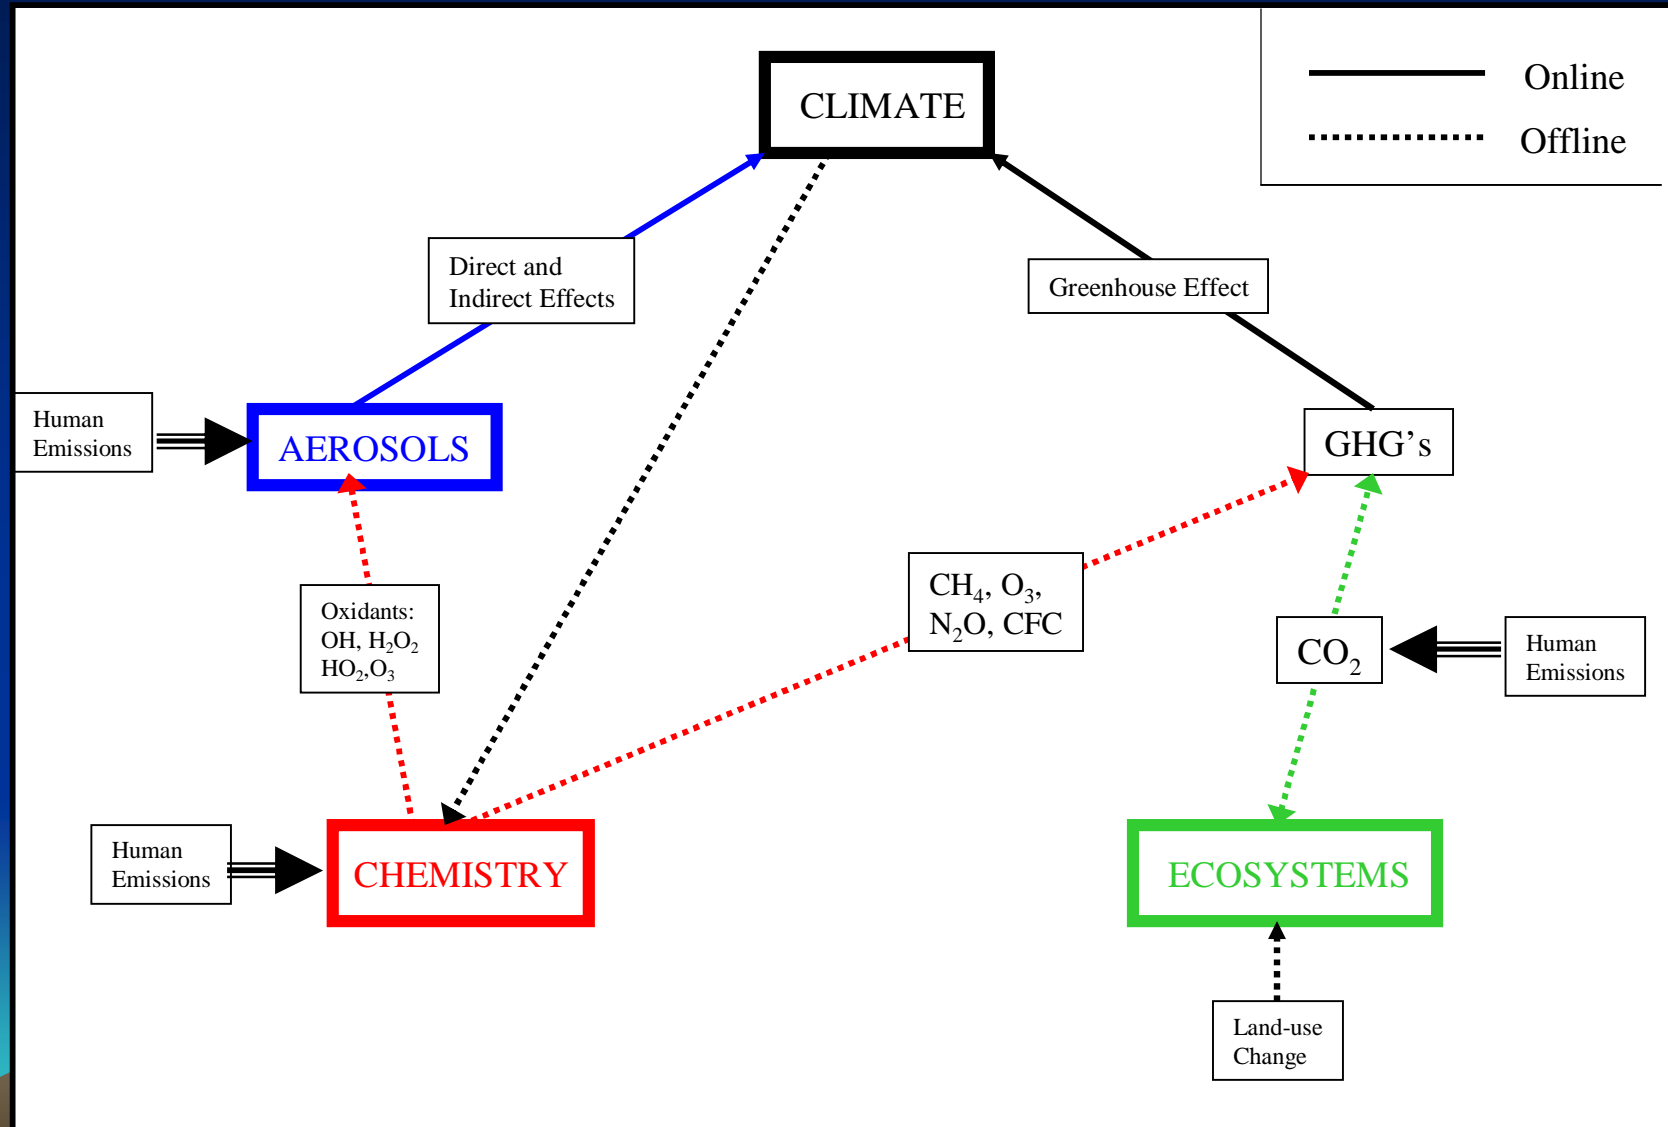

How to enhance the capability of our models to simulate the past and project future environmental and societal changes both in Northern Eurasia and globally?

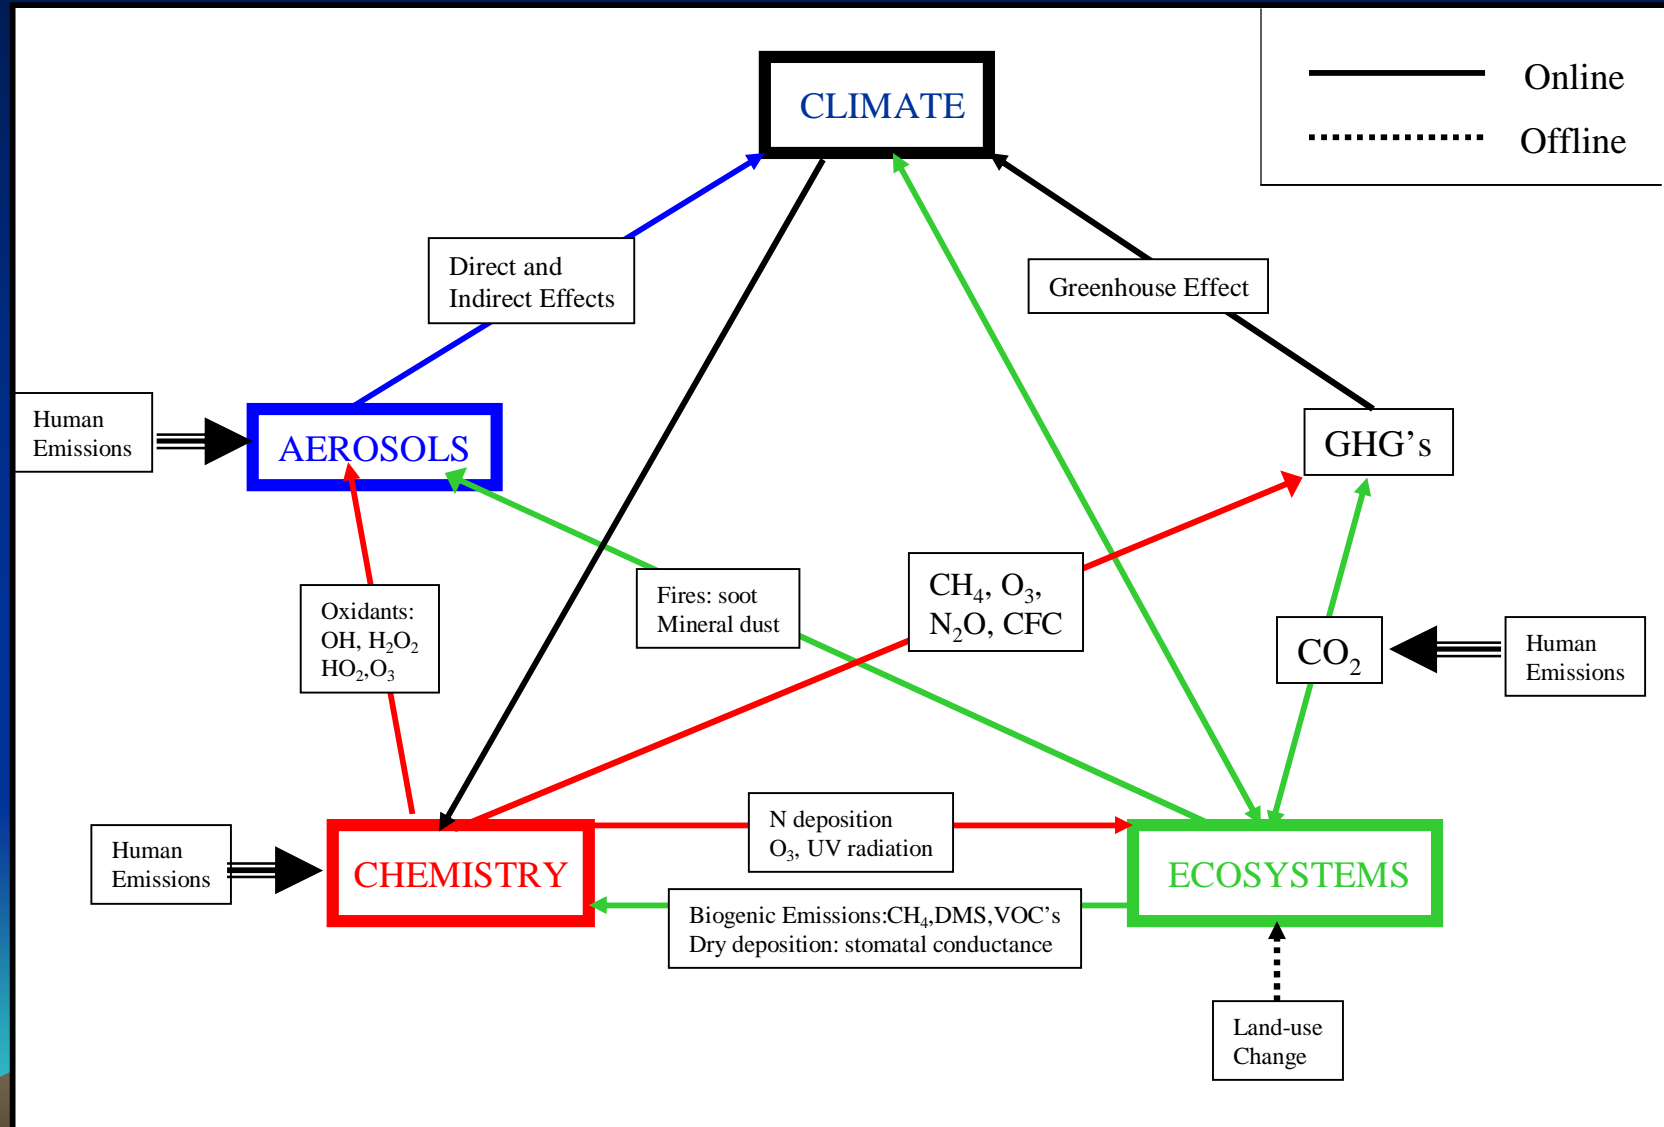

Hadley Centre Global Environment Model 2 (HadGEM2) – prototype of an Earth System model

Hadley Centre's Climate System – Uncoupled Model

Climate System – Earth System Coupled Model

Example: Human- and Lightning-Induced fires

- Natural and anthropogenic fires affect atmospheric chemistry and climate by injection of large amounts of aerosols and greenhouse gases (Andreae et.al., 1988)
- Totally fires consume 5% of terrestrial net primary production, resulting in emitting 2-3 PgC/year (Randerson, et.al., 2002). This constitutes a half to 2/3 of current fossil fuel emissions.
- Majority of fires are human-induced – 97% in Spain (Vasques, et.al, 2002), **60-80% in Russia** (Shvidenko and Nilsson, 2002)
- Lightning fires account for disproportionately large area burnt in boreal zone – 38% of 10000 fires that occur each year in Canada result in 82% of area burned nationwide (Stocks et.al., 2002)

FRIDAY'S RESULTS

Do you think human activity is causing global warming?

CAST YOUR VOTE ON TODAY'S POLL QUESTION AND CHECK OUT LINE-BY-LINE AND STATION-BY-STATION RESULTS FROM YOUR FELLOW METRORAIL COMMUTERS. READEXPRESS.COM/POLLCENTER.PHP

Integrated Assessment of Global Fires in the GCM HADCM3LC: A Prototype of an Earth System model

- Implementation of fire risk (fire weather) functions into GCM
- Simplification of human ignitions functions, accounting for urban and agricultural tiles in GCM
- Simplification and re-parameterization of area burnt functions for simplified vegetation types. Design of fuel functions from vegetation carbon and soil carbon.
- Developing interaction between land-surface scheme and the fire model (providing disturbance rate for vegetation model, getting moisture and fuel)

Tools

- Remote sensing satellite observations
 - Optical
 - High resolution multispectral (Landsat)
 - Moderate resolution multispectral (AVHRR, MODIS)
 - Lidars
 - Microwave
 - Passive
 - Radars
- Airborne and in situ observations
- Intensive field campaigns
- Basic process studies and case studies
- Modeling and integrative data analysis
- Data and information systems

Earth Observation Systems in Space

- **Optical**

- Coarse resolution 1-2 km:
AVHRR, SeaWiFS, OLS,
Vegetation, ATSR, Geostationary
- Moderate resolution 0.2-1 km:
MODIS, MISR, MERIS
- High resolution 5-30m:
Landsat(s), ASTER, ALI, Hyperion,
CIBRS, IRS
- Hyper-spatial resolution 1-4 m:
IKONOS, ORBVIEW

- **Microwave**

- Passive: DMSP/SSMI, AMSU
- Active: Radars

**AVHRR Continuous
Fields Tree Cover
Product**

**1992-04-01 -
1993-04-01**

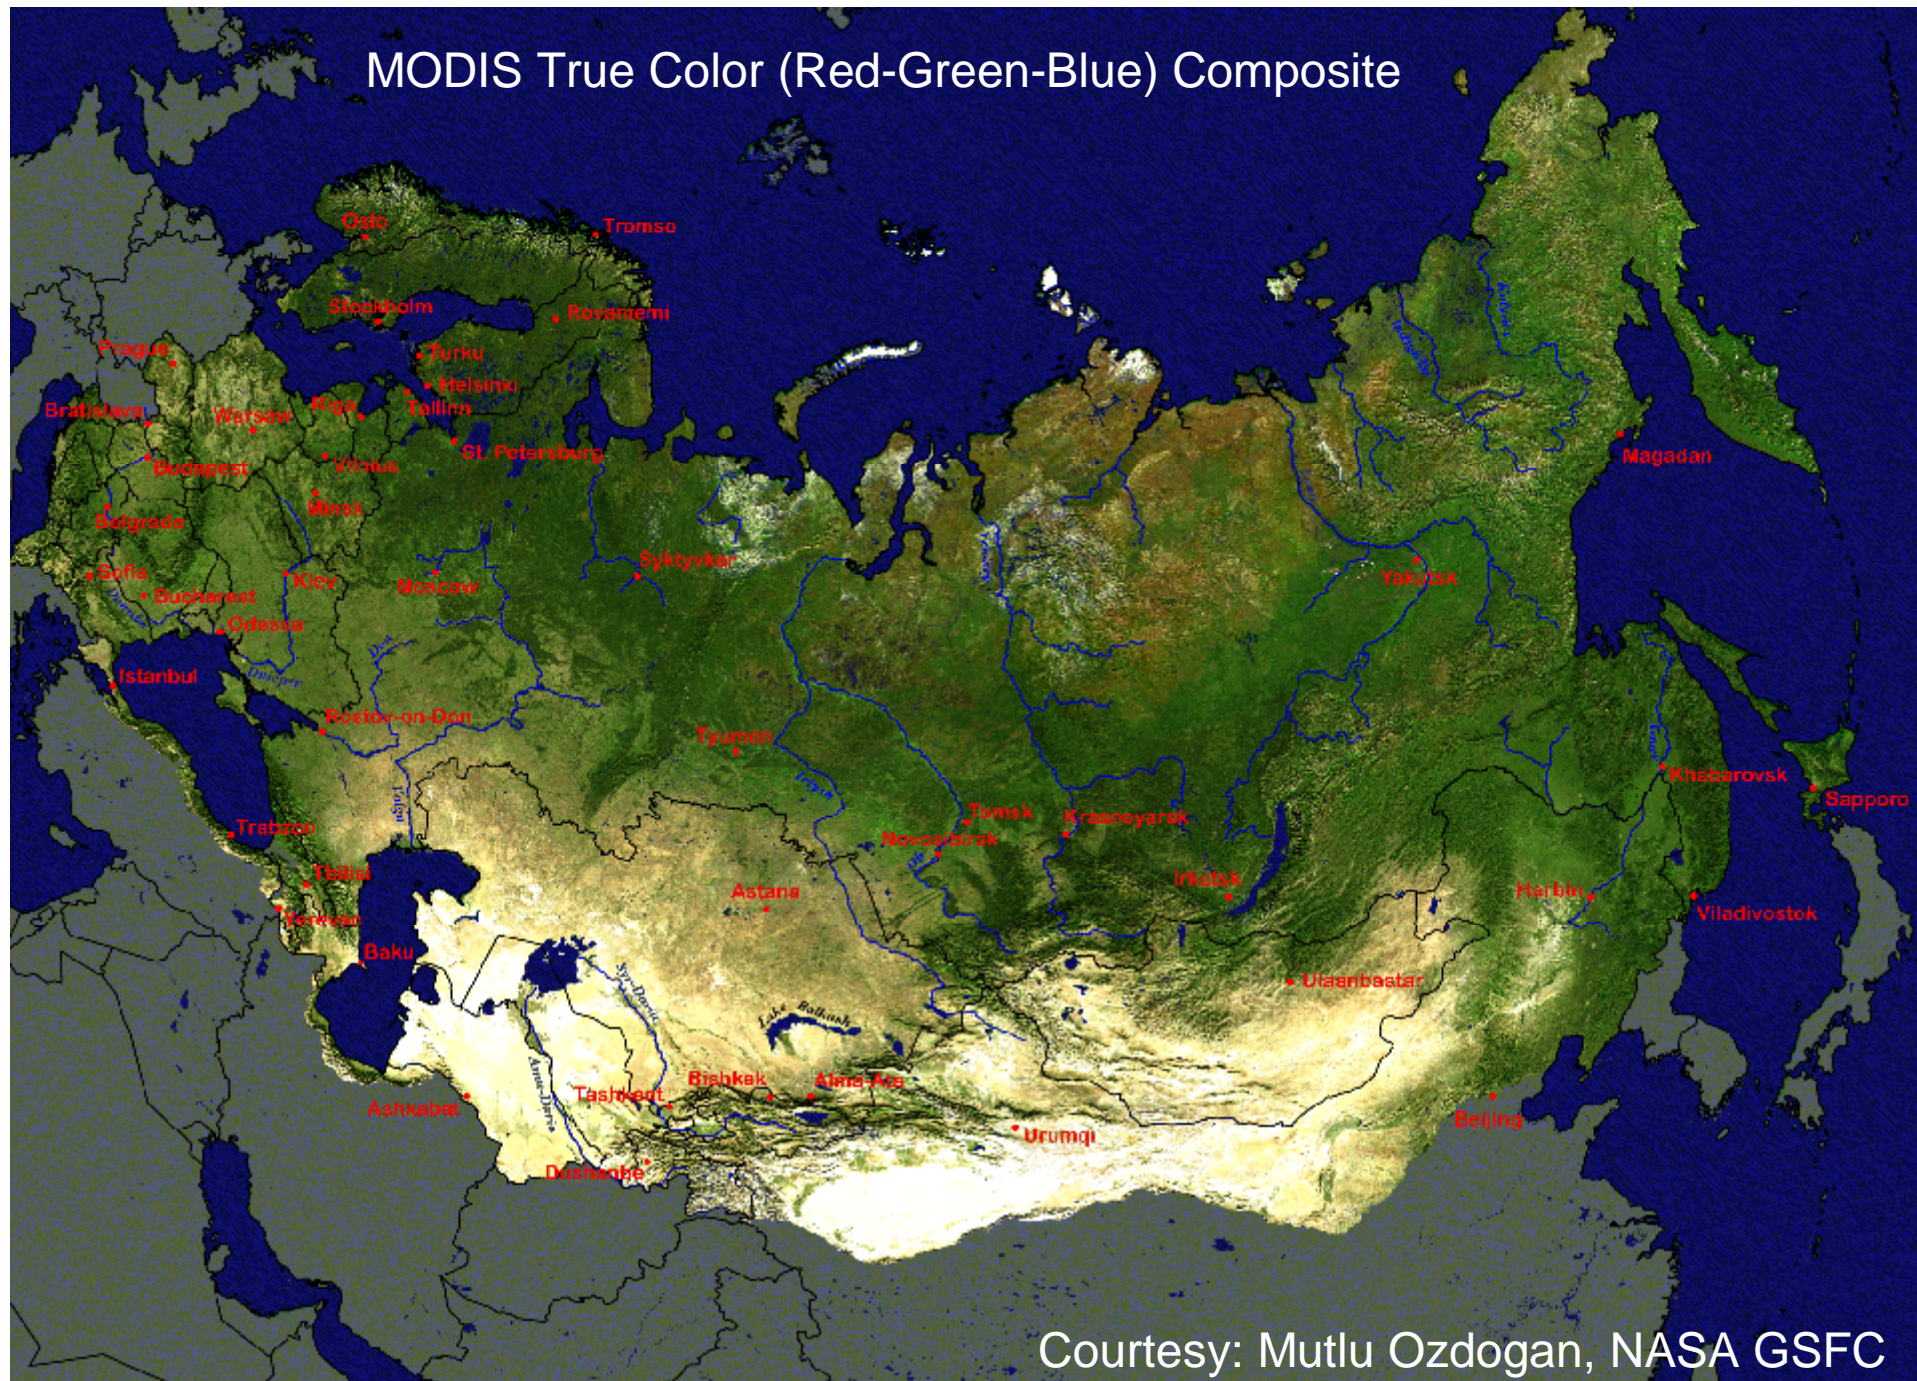

**AVHRR Global Land
Cover Product**

**1981-01-01 -
1994-12-31**

**VEGETATION

SIBERIA

SAR Imaging for Boreal Ecology and Radar Interferometry Applications

EU Community Funded
(ENV4-CT97-9743-SIBERIA)

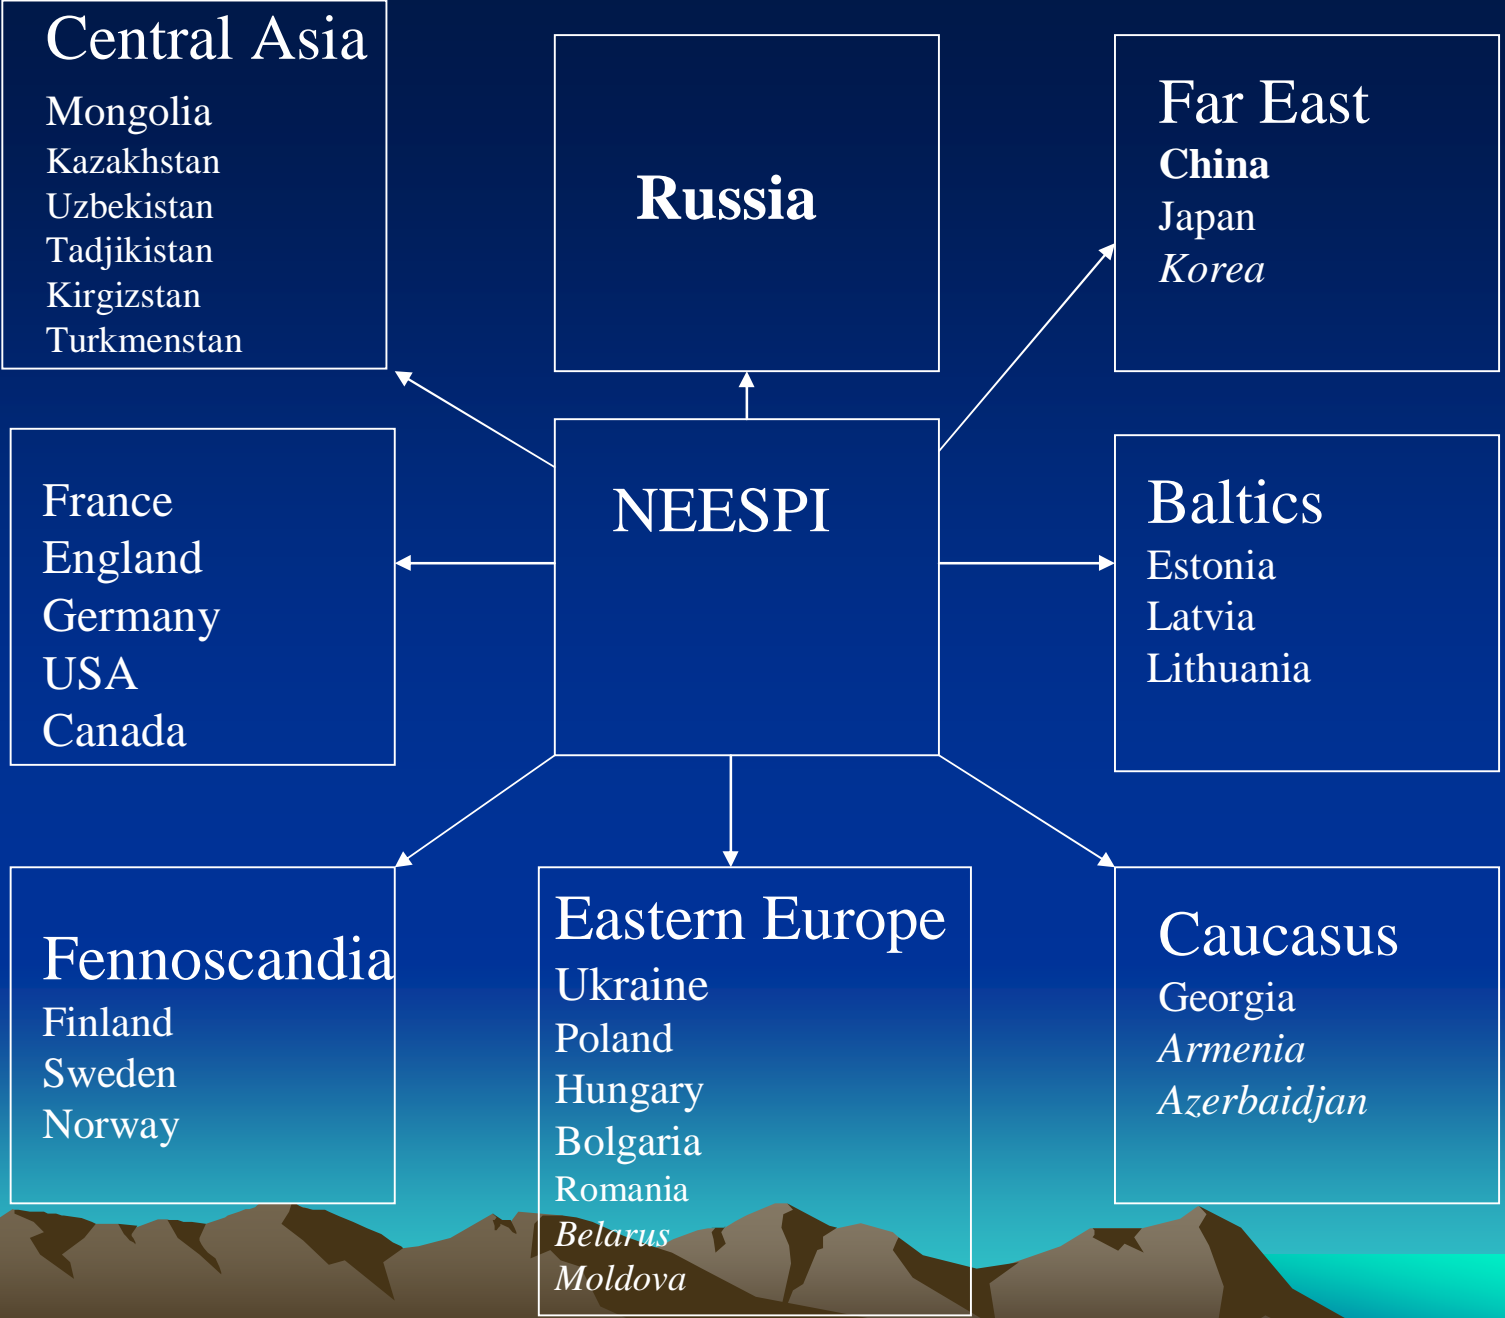

A stylized, pixelated Earth is centered in the image. The continents are rendered in shades of yellow and green, while the oceans are dark blue. A red circle is drawn around the central part of the globe. Overlaid on this circle is the word "NEESPI" in a bold, yellow, blocky font with a black outline and a halftone dot pattern. The background is black, with a blue border at the top and bottom, and a small brown and cyan area at the bottom corners.

NEESPI

Northern Eurasia Earth Science Partnership Initiative (NEESPI)

- International, multi-agency program for Earth science research in northern Eurasia focused on ecosystem-climate interactions
- Comprehensive: Almost a quarter of the global land, representing most of the existing geo-botanic zones except for tropical; multi-disciplinary program covering basic terrestrial, environmental disciplines
- Important: An area of the globe with early indications of the global climate change
- Challenging: many countries, many languages, different mentalities, remote locations
- Advantageous: plenty of data, talents; existing infrastructure

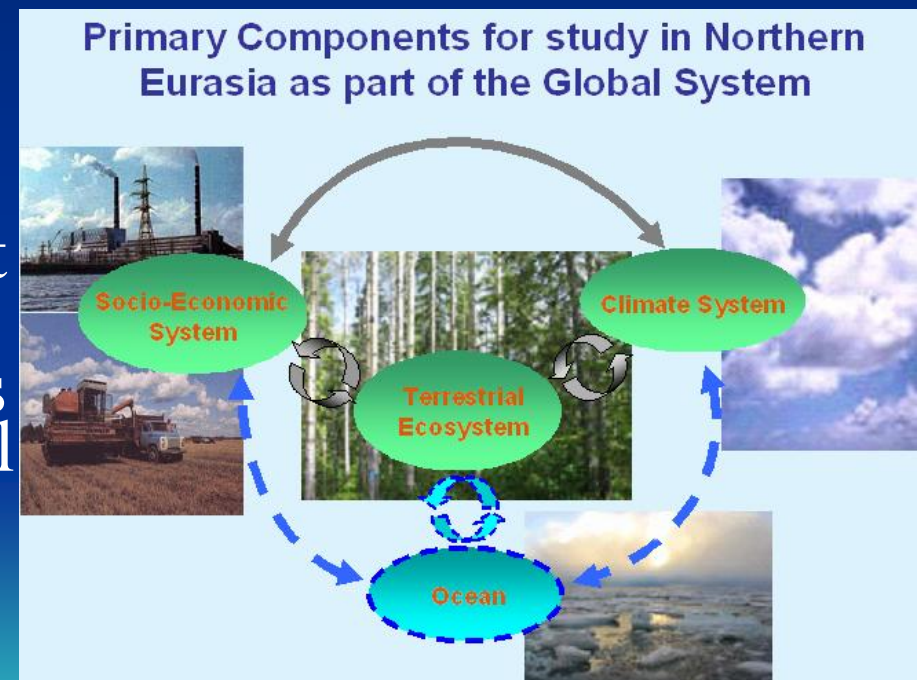

NEESPI Science Agenda

Focus on climate-ecosystem interactions and societal impacts in boreal and non-boreal zones of Northern Eurasia

Goal:

- To evaluate the role of anthropogenic impacts on the regional ecosystems and climate and how it may affect the global climate
- To evaluate the consequences of global changes for regional environment, the economy and the quality of life in the region

NASA Role in NEESPI

- Lead the NEESPI remote sensing component
 - Develop and maintain a regional satellite data base with raw data and products
 - Develop and distribute special remote-sensing based datasets useful for climate modeling
 - Facilitate access to satellite data and products by NEESPI investigators
 - Support regional calibration/validation activities
- Contribute to the support of Focus Research Centers, Science Data Centers, NEESPI logistics
- Support regional network activities
- Support NEESPI projects with a remote sensing component that were peer-reviewed and selected for

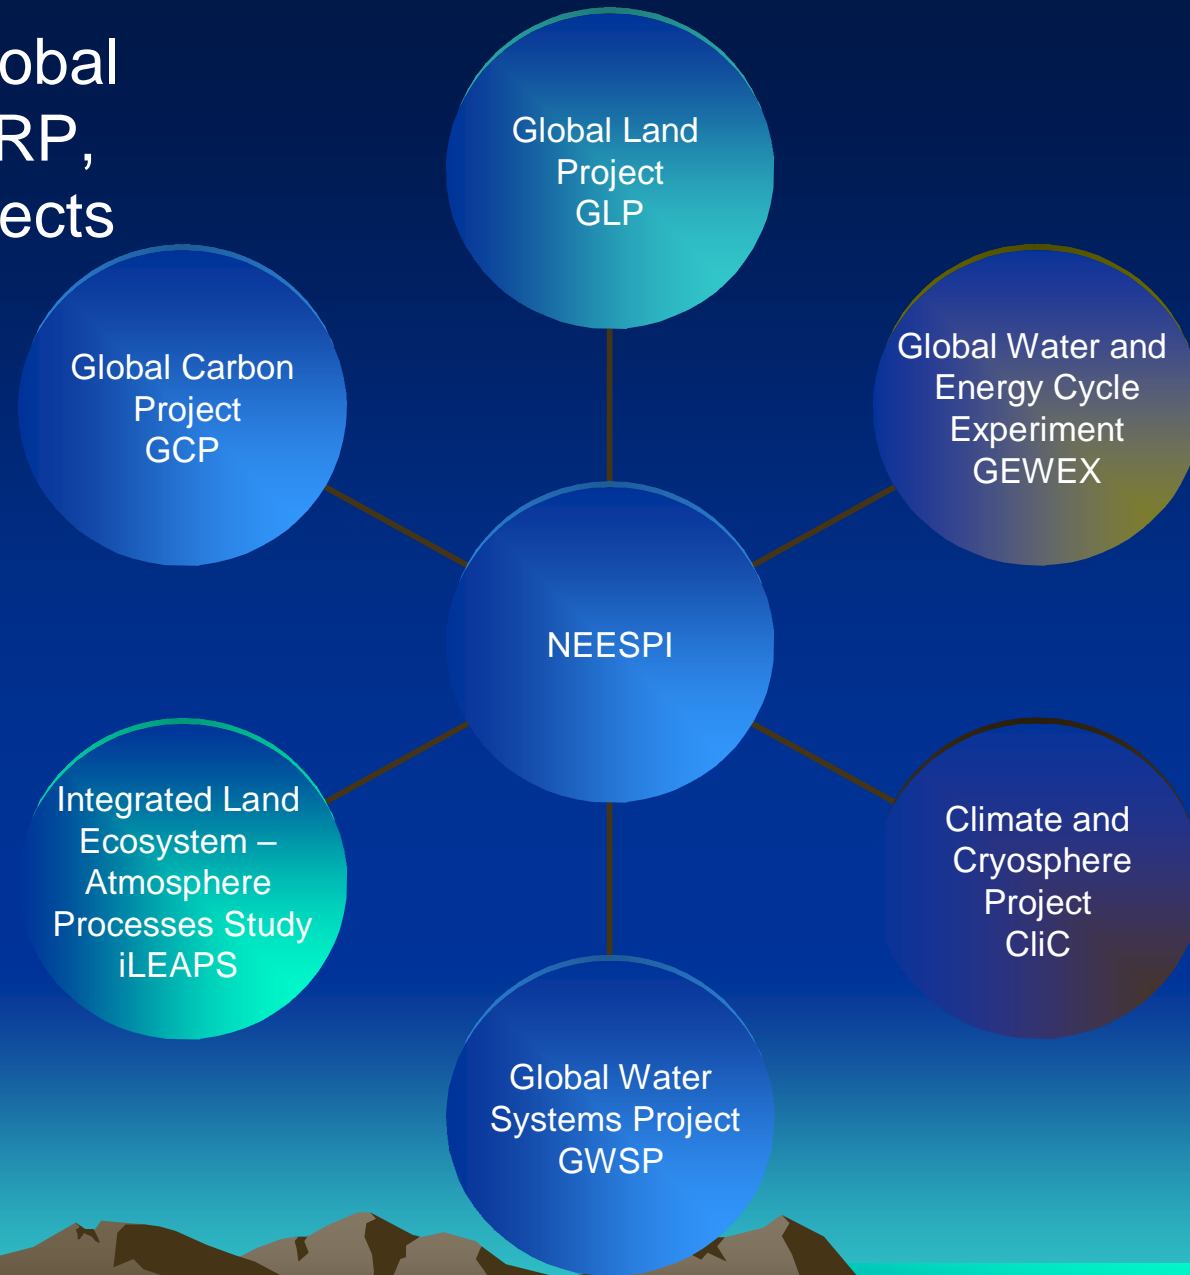

funding by NASA

NEESPI Boreal Projects (~ \$3.5 M/yr for 3 years)

- **Modeling the Carbon Dynamics of the Eurasian Boreal Forest**
- **An Integrated Analysis of Flux Tower Data, Remote Sensing Data and Biogeochemical Modeling**
- **Comparative Studies on Carbon Dynamics in Disturbed Forest Ecosystems**
- **Quantifying Effects of Fire Intensity/ Severity/ Burning Conditions on Carbon Stocks and Exchanges**
- **Impacts of Lake and Wetland Extent on the Regional Carbon Balance**
- **Land-Use and Land-Cover Dynamics of China**
- **Role of LCLUC in Eurasian pan-Arctic hydrology**
- **Monitoring/Validating the Distribution and Change in NEESPI Land Cover**
- **LCLUC in Yamal Peninsula and Novaya Zemlya**
- **Weather-Extreme Fire Events-LCLUC relationships in the Changing Climate of Siberia**
- **Current climate changes over Eastern Siberia and their impact on permafrost landscapes, ecosystem dynamics, and hydrological regime**
- **Permafrost Dynamics within the Northern Eurasia Region and Related Impacts on Surface and Sub-Surface Hydrology**
- **An integrated understanding of the terrestrial water and energy cycles across the NEESPI domain through observations and modeling**
- **The Eurasian freshwater cycle from GRACE and in-situ hydrologic networks: distinguishing water cycle behavior in permafrost and non-permafrost regions**
- **Area-stage relationships in rivers and wetlands: Tracking the high-latitude water cycle and provision of core knowledge requirements for a Surface Water satellite mission**
- **Continuous fields of snow cover characteristics derived through coupling satellite data with snowpack model: Application in the river runoff modeling over NEESPI domain.**

- Regional Hydromet Center, Obninsk, Russia

NEESPI Senior Scientists by country

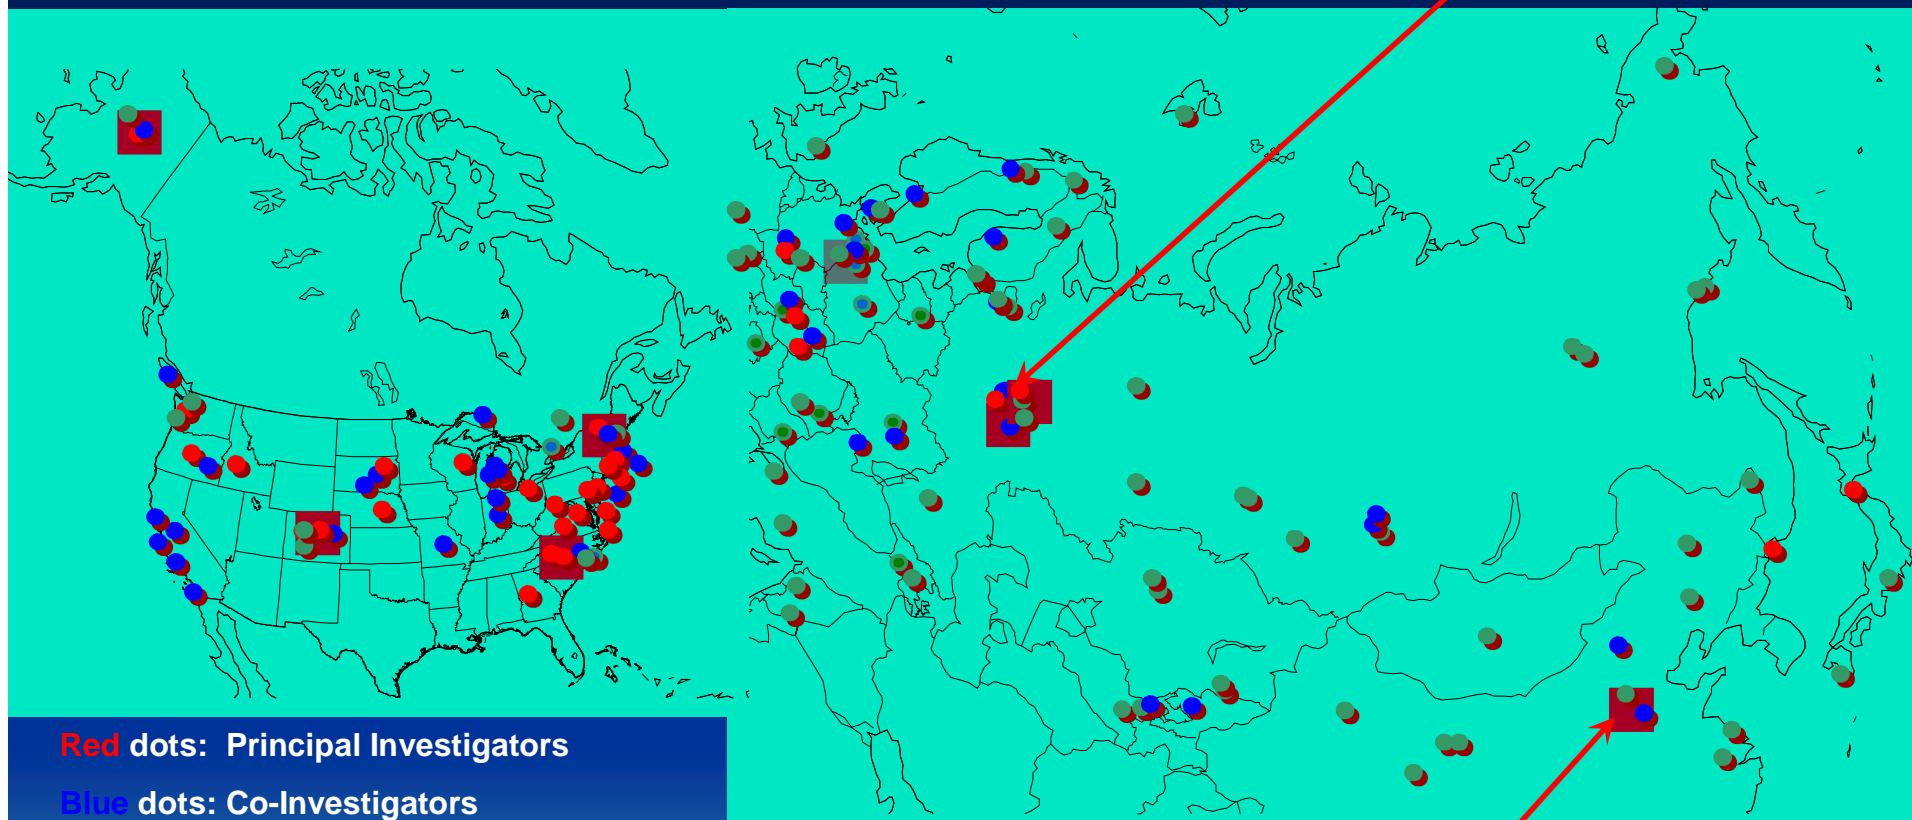

(~300 scientists from 170 institutions; ~50 projects)

- Russia 84 scientists 36 institutions
 - including Moscow 50 scientists 18 institutions
 - most active Institution: RAS Sukachev Institute of Forest Research (6sci. in 7 projects)
- China 26 scientists 15 institutions
 - most active Institution: Institute of Botany, Chinese Acad. Sci. (5 scientists)
- United States 99 scientists 46 institutions
 - most active institution: University of Maryland (9 scientists in 9 projects)
- European Union 37 scientists 26 institutions 10 countries
 - including Finland 10 scientists 5 institutions
 - including Germany 10 scientists 8 institutions
- Japan International Arctic Research Center + 3 institutions
- Canada 4 scientists 4 institutions
- NIS countries, Mongolia, Korea, Syria, and Eastern Europe 37 scientists 33 institutions 14 countries

NEESPI Distribution

18 institutions in Moscow participate in 21 projects

Red dots: Principal Investigators

Blue dots: Co-Investigators

Green dots: Collaborators

Squares: Focus Research Centers and
Science Data Support Centers

6 institutions in Beijing participate in 5 projects

NASA NEESPI Support

- Carbon Cycle/LCLUC
 - 9 projects funded (started Jan '05)
- New Investigator Program
 - 2 biodiversity projects (Jan '05)
- LCLUC (Hydrology)
 - 7 projects funded (started October '06)
- LCLUC (Climate, Monitoring, Impacts)
 - 6 projects funded (start Jan '06)
- Terrestrial Hydrology
 - 6 projects funded (start Jan '06)
- ACCESS (Data Systems Program)
 - 1 project (starts in Jan '06)

Total about \$7.5 M per year

NEESPI Projects

- >30 NASA projects
- >15 non-NASA projects
- The first NEESPI Science Team meeting in February 2006

NASA Boreal NEESPI Projects: Carbon/Ecosystems/LCLUC

- Carbon dynamics modeling
 - Modeling the Carbon Dynamics of the Eurasian Boreal Forest
 - An Integrated Analysis of Flux Tower Data, Remote Sensing Data and Biogeochemical Modeling
 - Comparative Studies on Carbon Dynamics in Disturbed Forest Ecosystems
- Land-cover change monitoring
 - Land-Use and Land-Cover Dynamics of China
 - Monitoring/Validating the Distribution and Change in NEESPI Land Cover
 - LCLUC in Yamal Peninsula and Novaya Zemlya
 - Forest structure derived from EOS data
- Fires
 - Biomass Burning in Northern Eurasia
 - Quantifying Effects of Fire Intensity/ Severity/ Burning Conditions on Carbon Stocks and Exchanges
 - Weather-Extreme Fire Events-LCLUC relationships in the Changing Climate of Siberia
- Ecosystems and Biodiversity
 - Impact of LCLUC on Siberian tigers
 - Impacts of LCLUC on biodiversity in Eastern Europe

NASA Boreal NEESPI Projects: LCLUC/Hydrology

- LCLUC
 - Impacts of Lake and Wetland Extent on the Regional Carbon Balance
 - Role of LCLUC in Eurasian pan-Arctic hydrology
 - **Exacerbation of Flooding Responses Due to LCLUC in Carpathian region**
- Permafrost
 - Current climate changes over Eastern Siberia and their impact on permafrost landscapes, ecosystem dynamics, and hydrological regime
 - Permafrost Dynamics within the Northern Eurasia Region and Related Impacts on Surface and Sub-Surface Hydrology
- Surface Water
 - An integrated understanding of the terrestrial water and energy cycles across the NEESPI domain through observations and modeling
 - The Eurasian freshwater cycle from GRACE and in-situ hydrologic networks: distinguishing water cycle behavior in permafrost and non-permafrost regions
 - Area-stage relationships in rivers and wetlands: Tracking the high-latitude water cycle and provision of core knowledge requirements for a Surface Water satellite mission
- Snow
 - Continuous fields of snow cover characteristics derived through coupling satellite data with snowpack model: Application in the river runoff modeling over NEESPI domain.

Young NEESPI

- Education component is important
- Several NEESPI projects include young scientists from Northern Eurasia (Russia, China, etc.)
- A structure for NEESPI-Education is being established (Georgia Tech., U.Michigan, AEROCOSMOS, CERT)

Getting Involved

- Ask your adviser/boss/chief to contact NEESPI Project Scientist (Pasha Groisman)
- Make a potential US/EU partner interested in using your expertise/model/data in their own activities
- Prepare together with your US/EU partner a proposal to your future potential sponsor (e.g. NASA – the proposal is submitted by the US partner)
- Pray and hope that your proposal will get good reviews and selected in the competition, which is usually tough
- Become a NEESPlan
- Decent knowledge of English is required

Benefits to NEESPI members

- Improved links to collaborators in Northern Eurasia and to US and EU scientists working on similar problems
- Exchange of ideas, datasets, and knowledge with other team members working on similar problems
- Synergistic approach in working on complex problems
- Priority access to remote sensing and in situ data collected over Northern Eurasia through the Science Data Support Centers. In many cases they will be provided free of charge.
- **Education: student exchange, doctoral and post-doc positions**

Join the NEESPI family!

BACKUP SLIDES

LCLUC and Hydrology

Funded NEESPI Projects (started in October, 2005)

Arid (Partners: Russia, Kazakhstan, Uzbekistan, China)

- Impacts of Glacial Area Changes in Central Asia During on LCLUC
- Role of LCLUC in Water Budget and Water Use Across Central Asia
- Assessing the vulnerability of the Eurasian semi-arid grain belt
- Ecological Monitoring in Semi-Arid Central and West Asia
- Effects of Land Use Change on the Energy and Water Balance of the Semi-Arid Region of Inner Mongolia
- Linking Biophysics and Socio-economics for Addressing Water Vulnerability in Central Asia

NON-Arid (Partners: Ukraine)

- Exacerbation of Flooding Responses Due to LCLUC in Carpathian region

About \$1.1 M per year for 3 years

Carbon Cycle Science and LCLUC

Funded NEESPI Projects (started in January, 2005)

BOREAL (Partners: Russia, China and Germany)

- Modeling the Carbon Dynamics of the Eurasian Boreal Forest
- An Integrated Analysis of Flux Tower Data, Remote Sensing Data and Biogeochemical Modeling
- Comparative Studies on Carbon Dynamics in Disturbed Forest Ecosystems
- Quantifying Effects of Fire Intensity/ Severity/ Burning Conditions on Carbon Stocks and Exchanges
- Impacts of Lake and Wetland Extent on the Regional Carbon Balance
- Land-Use and Land-Cover Dynamics of China

NON-BOREAL (Partners: Ukraine, IIASA, Kazakhstan, Uzbekistan, Mongolia)

- Carbon, Climate and Managed Land in Ukraine: Integrating Data and Models of Land Use
- Quantifying the Effects of Land Use Change on Carbon Budgets in the Black Sea Region
- Northern Eurasian Carbon-Land Use-Climate Interaction in the Semi-Arid Regions

About \$1.9 M per year for 3 years

LCLUC

Funded NEESPI Projects (start in January, 2006)

Boreal (Russia)

- Role of LCLUC in Eurasian pan-Arctic hydrology
- Monitoring/Validating the Distribution and Change in NEESPI Land Cover
- LCLUC in Yamal Peninsula and Novaya Zemlya
- Weather-Extreme Fire Events-LCLUC relationships in the Changing Climate of Siberia

Non-boreal (Central Asian countries, Ukraine)

- Role of LCLUC and atmospheric dust loading and their coupling on climate change in dry-lands
- LCLUC effects on surface water quality in Dnieper and Don river basins

About \$1.1 M per year for 3 years

Terrestrial Hydrology

Funded NEESPI Projects (start in January, 2006)

Permafrost

- Current climate changes over Eastern Siberia and their impact on permafrost landscapes, ecosystem dynamics, and hydrological regime
- Permafrost Dynamics within the Northern Eurasia Region and Related Impacts on Surface and Sub-Surface Hydrology

Surface Water

- An integrated understanding of the terrestrial water and energy cycles across the NEESPI domain through observations and modeling
- The Eurasian freshwater cycle from GRACE and in-situ hydrologic networks: distinguishing water cycle behavior in permafrost and non-permafrost regions
- Area-stage relationships in rivers and wetlands: Tracking the high-latitude water cycle and provision of core knowledge requirements for a Surface Water satellite mission

Snow

- Continuous fields of snow cover characteristics derived through coupling satellite data with snowpack model: Application in the river runoff modeling over NEESPI domain.

About \$1 M per year for 3 years

NASA-Funded Integrative Boreal Projects

- Modeling the carbon dynamics of the Eurasian Boreal Forest
- Current climate changes over Eastern Siberia and their impact on permafrost landscapes, ecosystem dynamics, and hydrological regime
- Diagnosis and Prognosis of Changes in Lake and Wetland Extent on the Regional Carbon Balance of Northern Eurasia
- Quantifying CO₂ fluxes from boreal forests in Northern Eurasia: An integrated analysis of flux tower data, remote sensing data and biogeochemical modeling
- Permafrost dynamics within the Northern Eurasia region and related impacts on surface and sub-surface hydrology
- Role of land cover and land use change in hydrology of Eurasian Pan-Arctic
- An integrated understanding of the terrestrial water and energy cycles across the NEESPI domain through observations and modeling
