NEELDA

(Northern Eurasia Landcover Dynamics Analysis)

7/17/2006

Olga N. Krankina, OSU

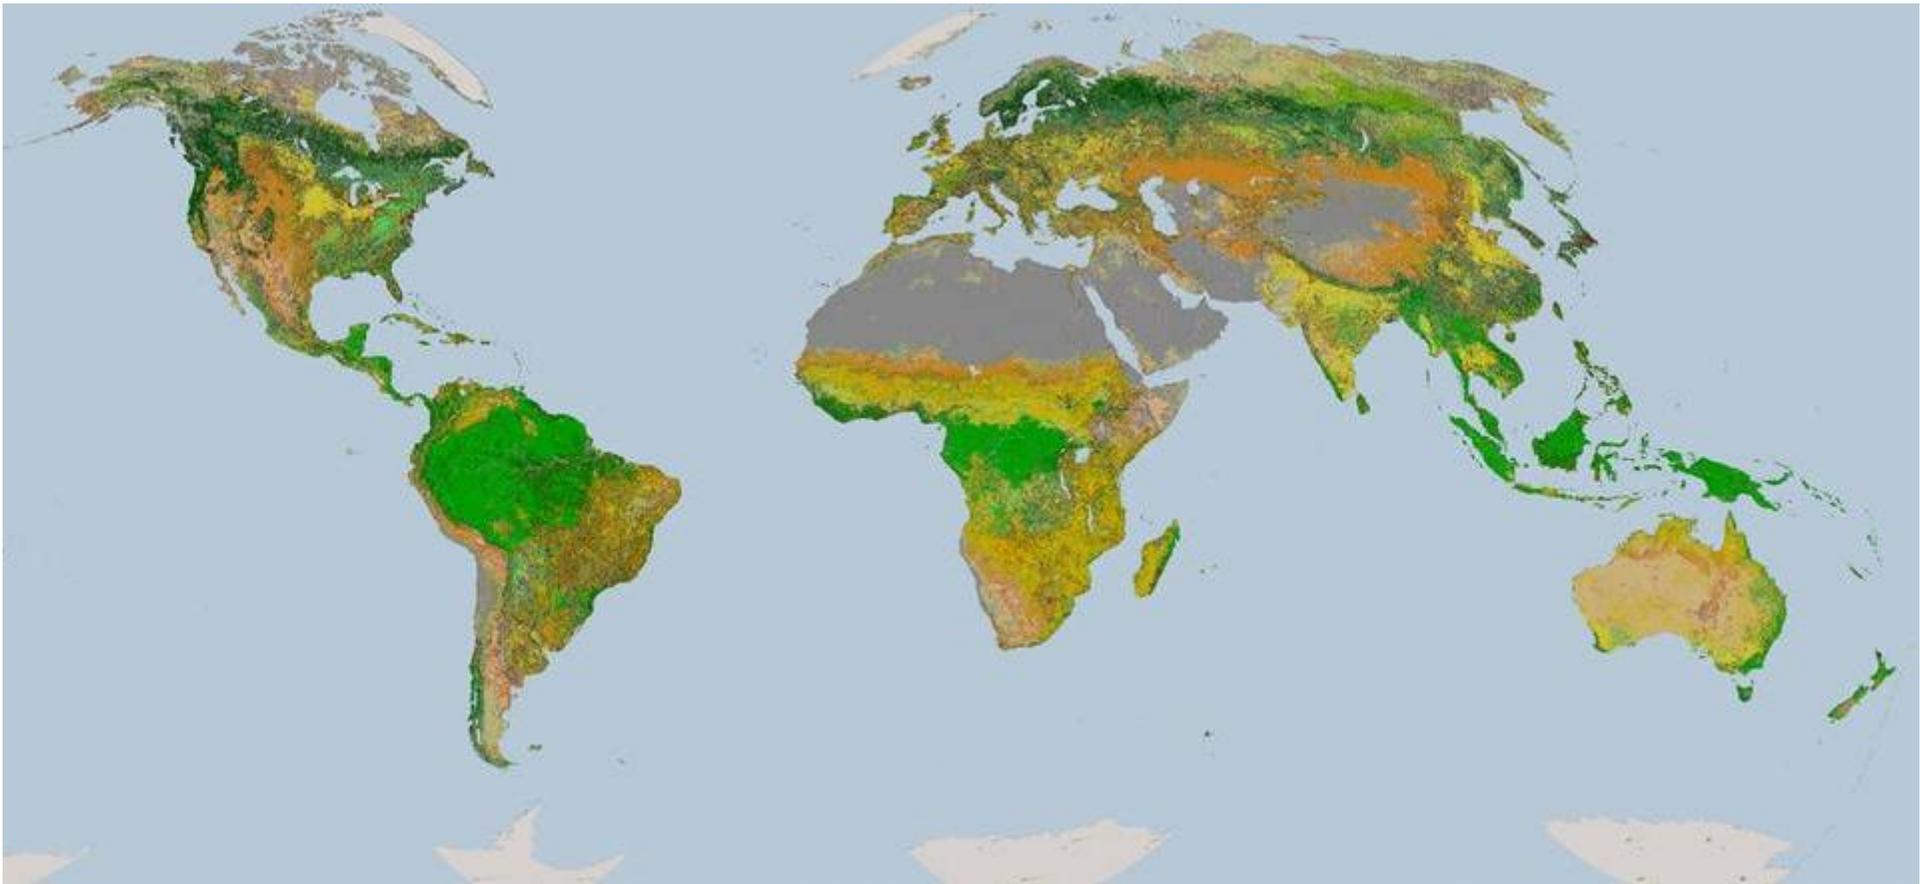

● WHAT?

- Develop a system for monitoring and validating the distribution and change in land cover across Northern Eurasia (Разработать систему мониторинга и валидации карт растительного покрова и его изменений)

● WHY?

- All maps are lies, some lie more than others (Все карты лгут, одни – больше, другие – меньше)
- Which maps work better for specific applications? (Какие карты лучше применять для конкретных задач?)
- It is possible to make a better map for Northern Eurasia (Есть возможность для создания лучших карт для Северной Евразии)

Approach

- Combine remote sensing data (Landsat, MODIS) and local knowledge of land-cover conditions and change to validate and improve land cover / land-cover change products for Northern Eurasia
 - establish a set of test sites for land cover / change analysis
 - use these sites to validate global and regional land cover / change products
 - develop methods for continental mapping of vegetation disturbance
 - produce a new, updated land cover map for Northern Eurasia based on MODIS data

Standardized with reference to
its mean value

“Disturbance Index” Transformation

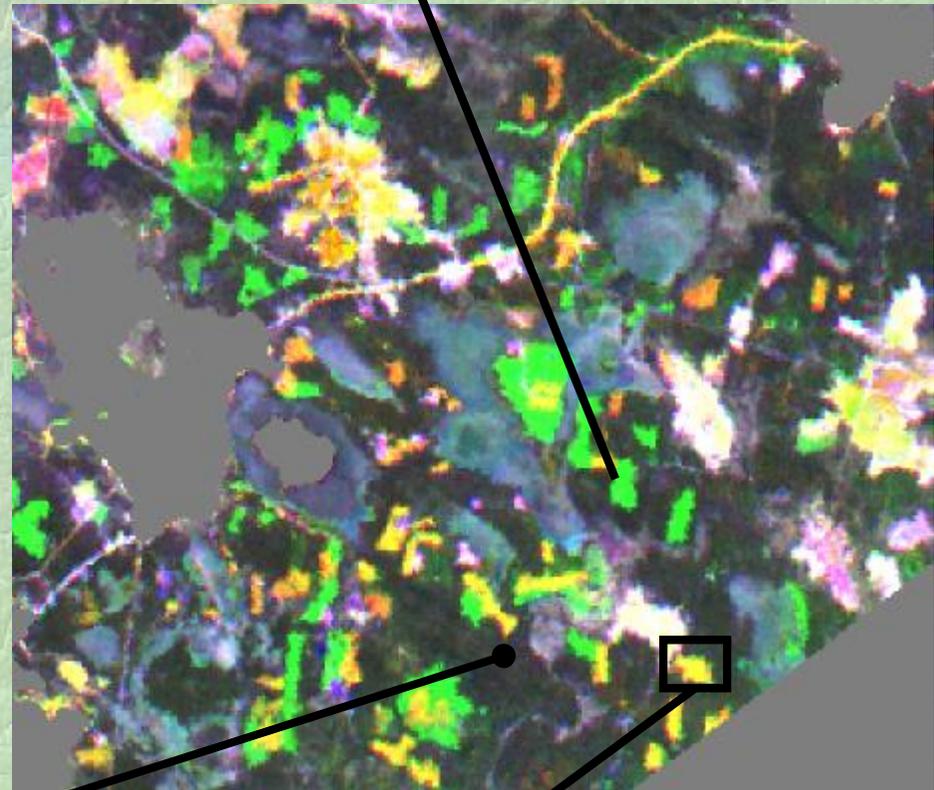

$$\text{Brightness} - (\text{Greenness} + \text{Wetness}) = \text{Disturbance Index}$$

Recently disturbed forests exhibit a higher brightness reflectance value, while greenness and wetness are typically lower.

Classification of disturbed sites by time intervals

NELDA Objective: Continental Forest Disturbance Maps

Several global MODIS products relate directly to ecosystem disturbance:

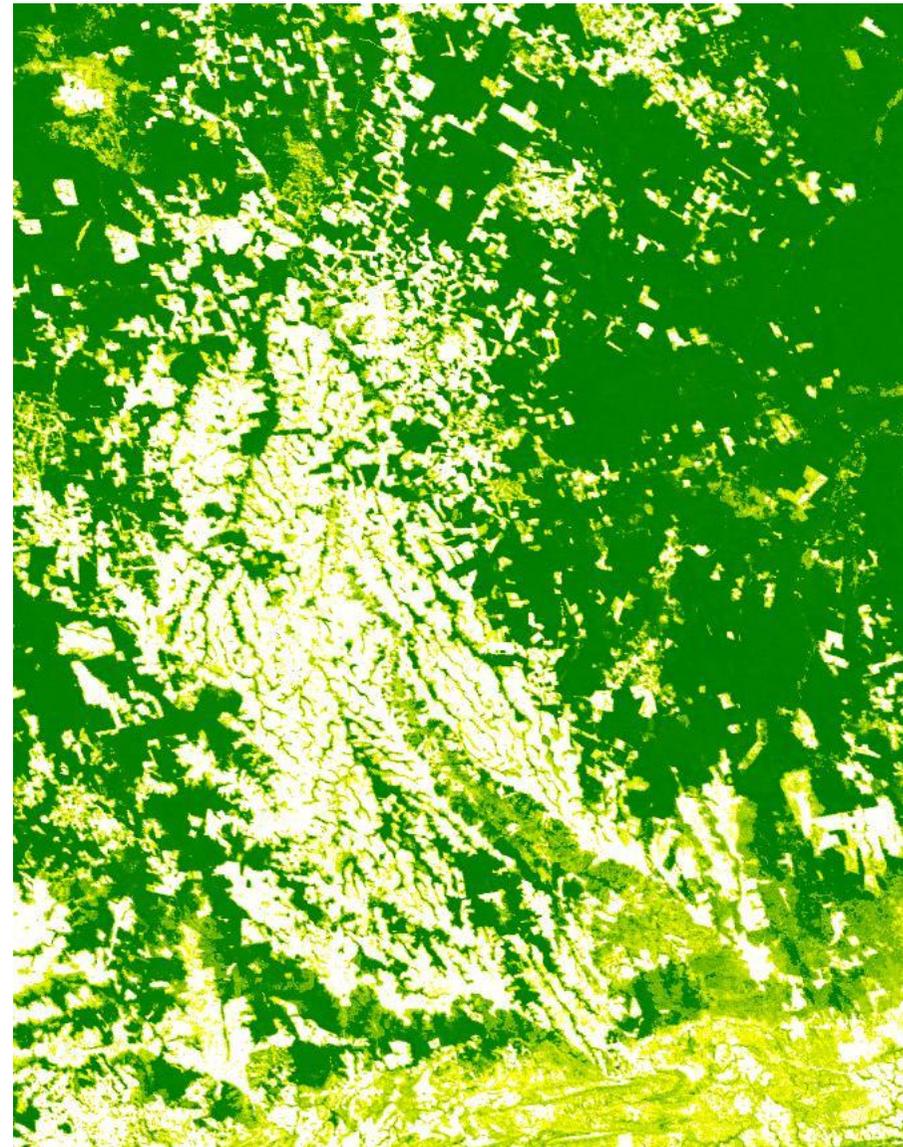

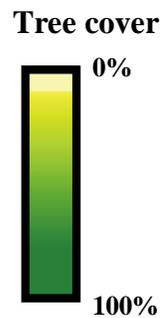

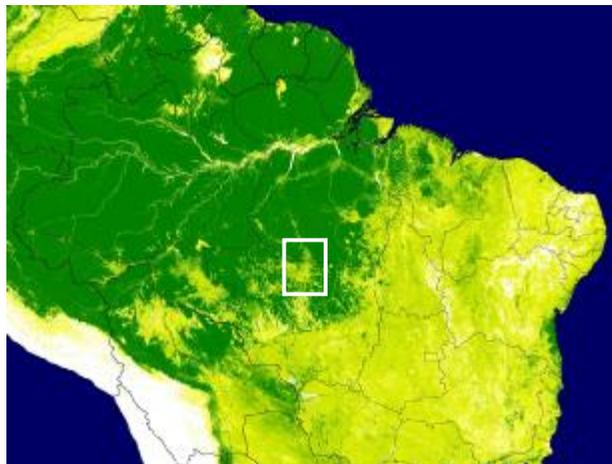

- Vegetation Continuous Fields (VCF) %Treecover/Herbaceous/Bare
- EVI / NDVI Vegetation Indices
- Active Fires, Burned Area

How can we use interannual records of these indicators to identify disturbance location, type, timing, and severity?

Example: MODIS VCF Treecover, Brazilian Amazon

Interannual changes from
2000-2002 correspond to recent
Forest clearing

MODIS Enhanced Vegetation Index (EVI) Product

Approach to Mapping Northern Eurasian Disturbance

1. Use NELDA test sites as high-resolution “truth” for typical forest disturbances in Northern Eurasia (fire, harvest/logging, insect damage, pollution damage)
2. Develop time series metrics for assessing probability of rapid changes in forest structure
 - Canopy leaf area (MODIS LAI, EVI product)
 - Canopy shadow fraction (MODIS SWIR reflectance)
 - Fractional tree cover (MODIS VCF product)
 - Fire activity (MODIS Active fire product)
3. Merge these indicators using a “fuzzy” or “voting” method to determine timing, type, and extent for forest disturbance at a regional (1-10km) scale.

Development of a New Land Cover Map of Northern Eurasia Using MODIS

Objective:

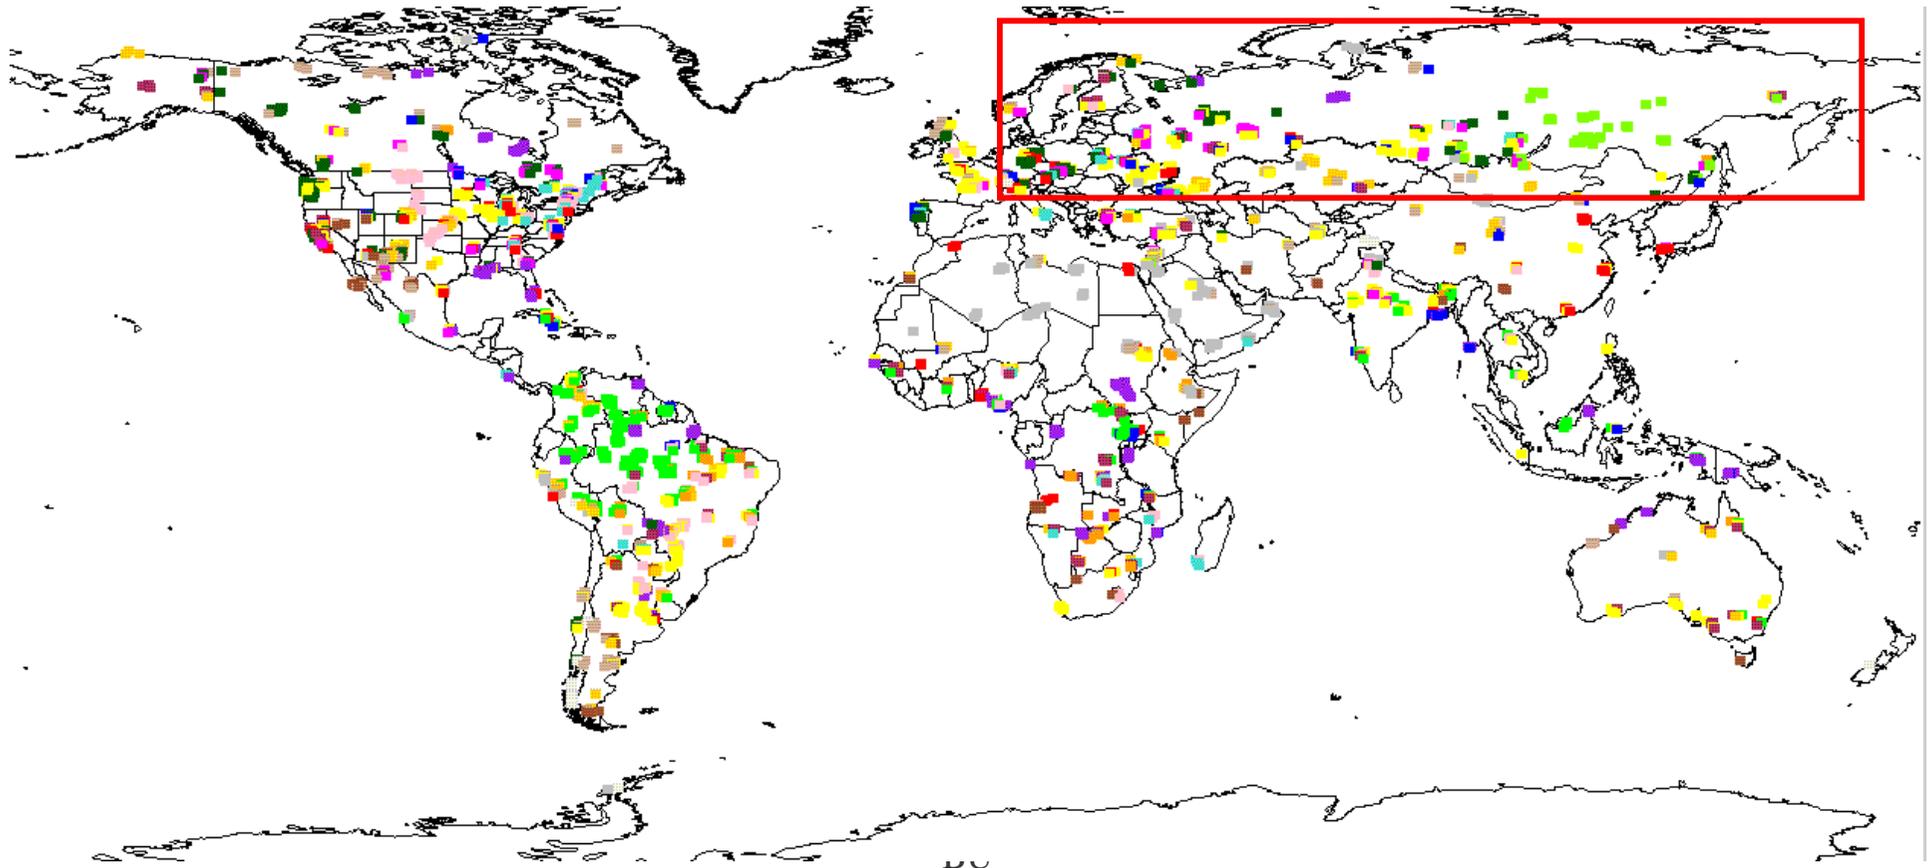

- Use MODIS data in association with training site data to create a map circa ~2005

Approach

- Modify MOD12 algorithm for regional processing
- Refine & augment MODIS site database
- Use LCCS classification system
- Validate using network of test sites

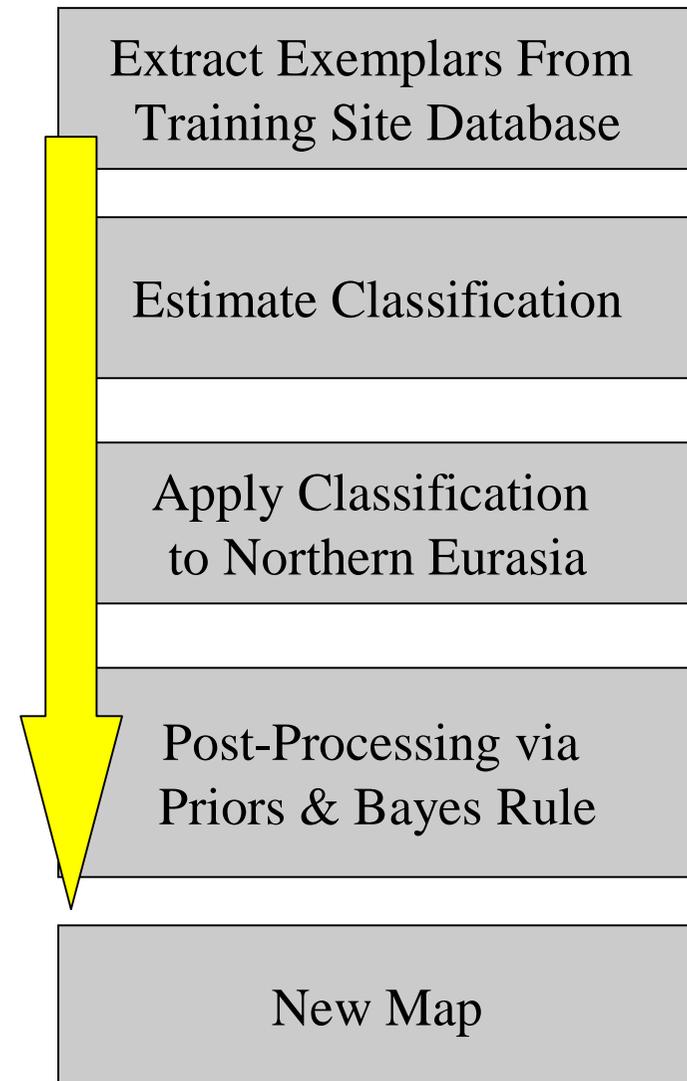

Training Site Development

- Live Database ~ 2300 sites globally
 - Northern Eurasia: ~200 sites
- Will *refine* and *augment* in support of LCCS
 - w/help from Russian collaborators (distinct from test sites)

MODIS Land Cover Processing Chain

- MODIS Data:
 - *Temporal and spectral information*
 - *32-day composites*
 - *500 m*
- Inputs
 - *Surface Reflectance (NBAR)*
 - *View-angle corrected surface reflectance*
 - *7 land bands*
- Enhanced Vegetation Index (EVI)
 - *Computed from NBARs*
- Annual Metrics
 - *Min, max, mean for each band, plus EVI*

Expected results

- 15 test sites
- MODIS-derived disturbance/ land-cover change map for Northern Eurasia for the period 2000-2006
- New regional land-cover map
- Strengthen the user community and serve as basis for future projects

Prospective new NELDA sites

- 14 additional sites proposed
- Cover additional vegetation types and regions within Northern Eurasia

NELDA contributes to broader regional and global programs

NERIN - Региональная Информационная Сеть по Северной Евразии

English: <http://www.fao.org/gtos/gofc-gold/net-NERIN.html> (оригинал данного сайта на английском языке)

Северная Евразия - крупнейший массив суши, расположенный вне тропиков, и обладающий самыми большими запасами органического углерода, а также являющийся областью активного изменения землепользования. Данный регион - один из основных источников неопределенности во многих крупномасштабных оценках, включая оценки поверхности земли, запасов и потоков углерода.

Основная цель NERIN - это содействие и координация проведения и поставки широкому кругу пользователей в Северной Евразии наблюдений за Системой Земли. NERIN также сотрудничает с агентствами по земле- и лесопользованию для обеспечения непрерывных высококачественных наблюдений для практических приложений и управления.

Сеть NERIN тесно связана с Инициативой Партнерства по наукам о Земле в Северной Евразии (**NEESPI**), которая является международной региональной программой научных исследований в области наук о Земле.

NERIN является неформальной сетью ученых и других специалистов, а также научных учреждений, сетей и проектов, работающих по тематике GOFC-GOLD и NEESPI.

На сайте размещены отчеты и другие материалы с семинаров NERIN, проведенных в **2001, 2004 и 2005 (отчет и копии докладов)** годах. Новый сетевой проект **NELDA** планируется начать в 2006 году; семинар по проекту NELDA запланирован на 8 июля в рамках конференции **ENVIROMIS-2006** в Томске, (1-8 июля 2006 г.).

В настоящее время NERIN собирает информацию о содержании, качестве, состоянии и других характеристиках доступных наборов данных, необходимых для поддержки новых исследований в Северной Евразии. Доступен **поиск по базе метаданных**. Также приветствуется **пополнение** этой базы. Источники данных дистанционных наблюдений по Северной Евразии можно найти в **ссылках** и **каталогах** GOFC-GOLD.
